The background of the slide is a photograph of a sunset or sunrise over a mountain range. The sky is a gradient of orange and yellow, with a bright sun visible in the upper right corner. The mountains in the foreground are dark and silhouetted against the bright sky.

:

Development of the Heat – Health Vulnerability Tool in North Carolina

Chip Konrad

Carolina Integrated Science & Assessments (CISA) team

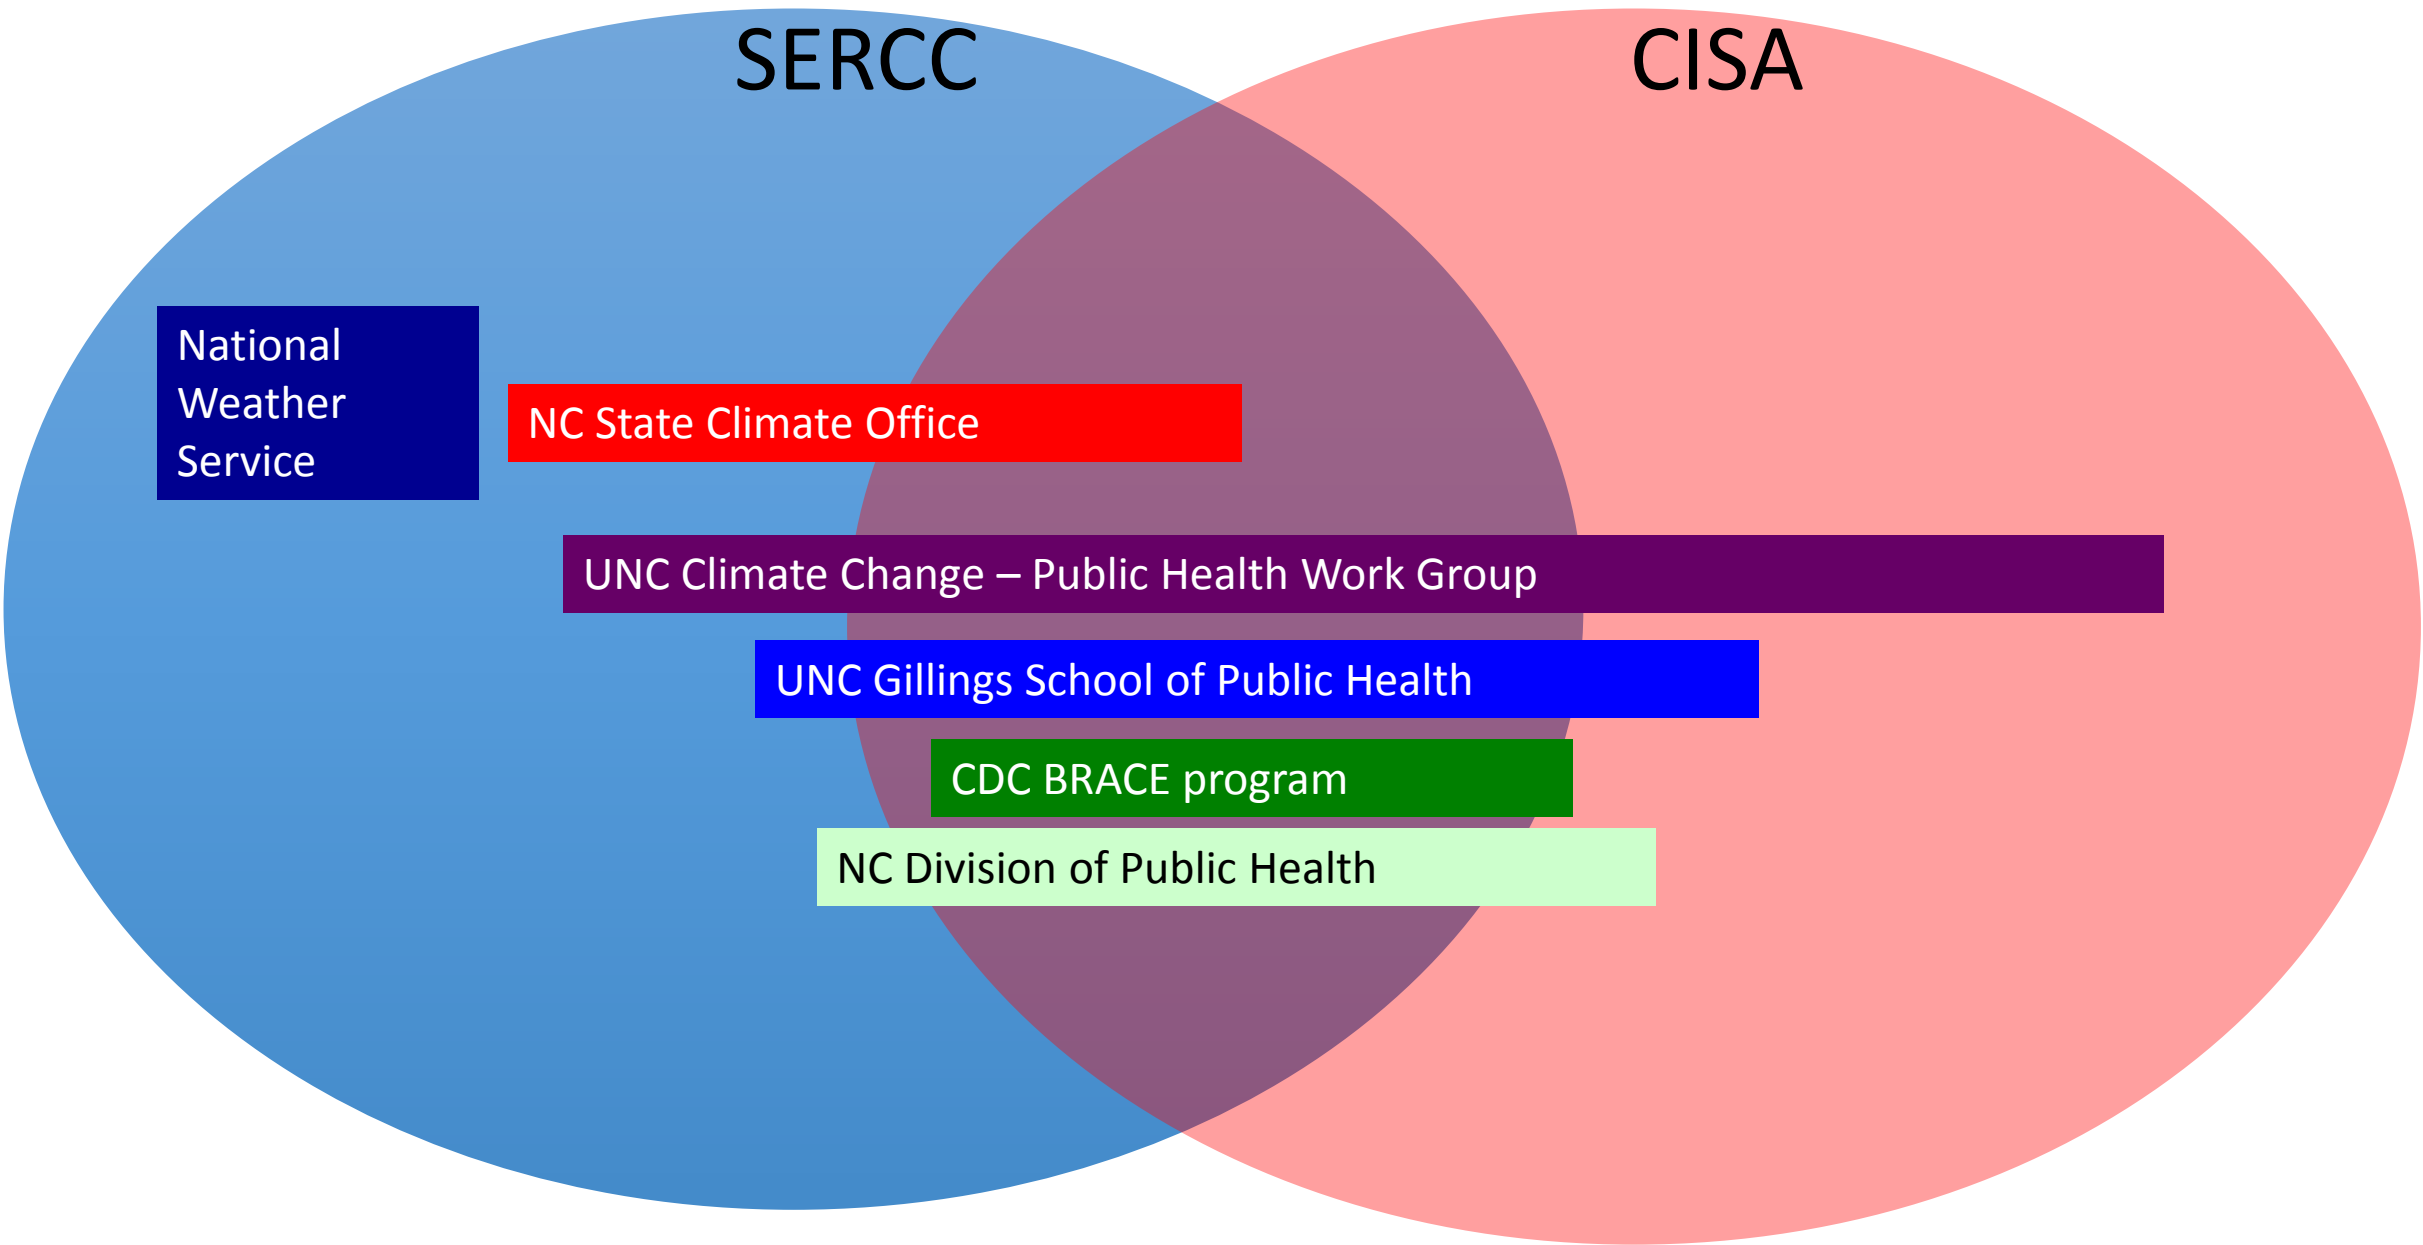

NOAA Southeast Regional Climate Center

University of North Carolina at Chapel Hill

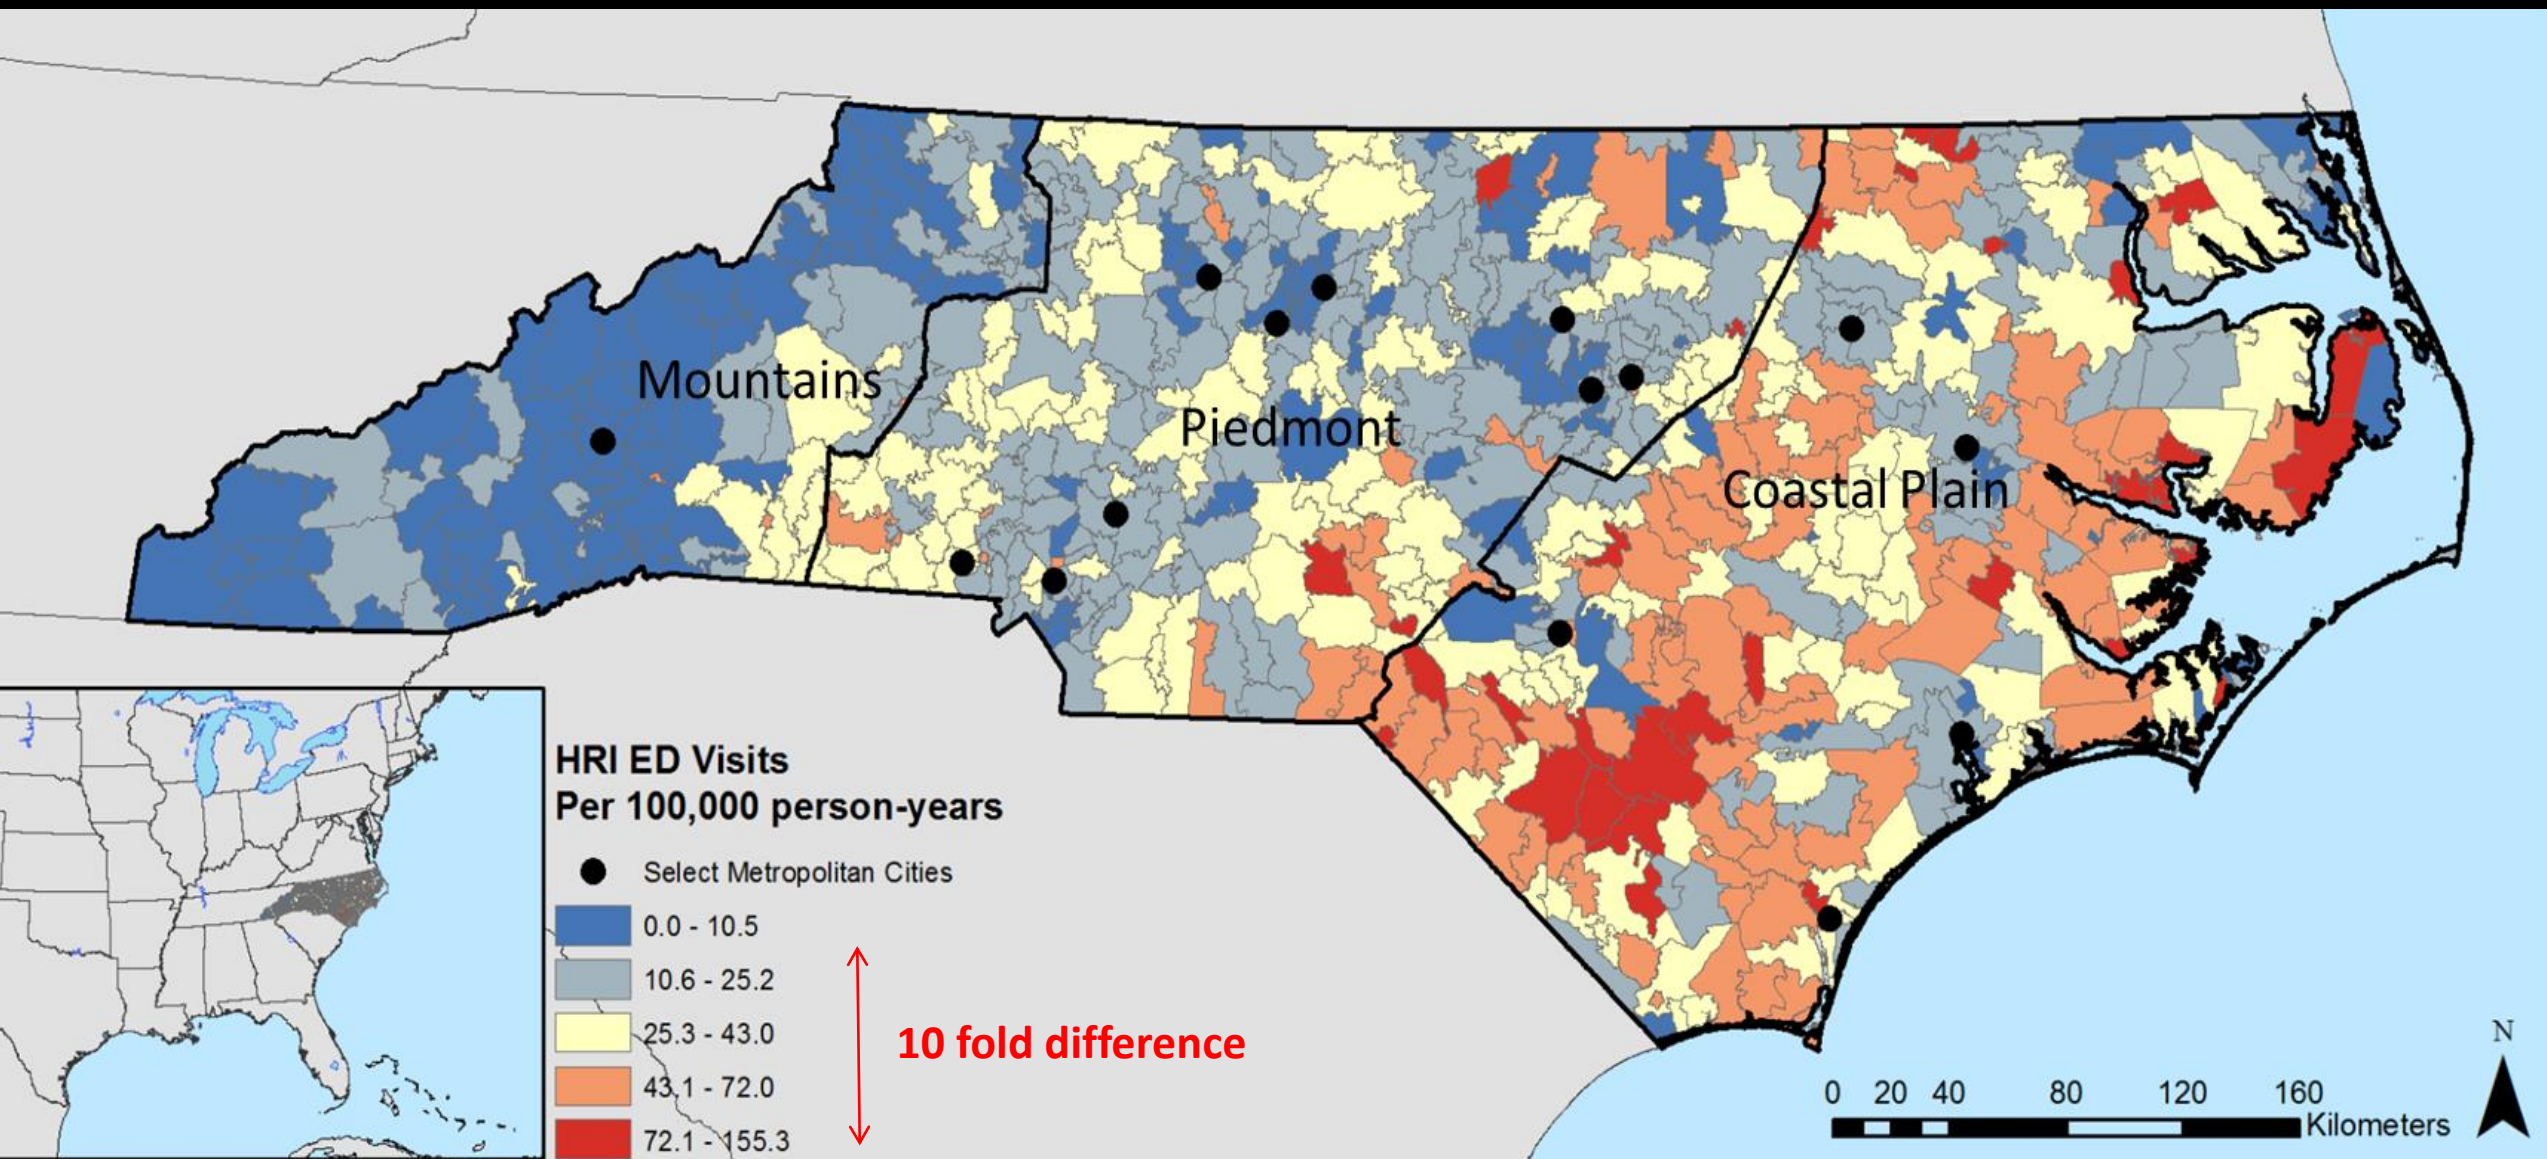

Outline

- 1) Background
- 2) Research to Identify Relationships between Temperature and Heat Illness.
- 3) Description of Heat Health Vulnerability Tool
- 4) Our Engagement with Stakeholders and What we Learned

Collaborators on Heat Illness Project

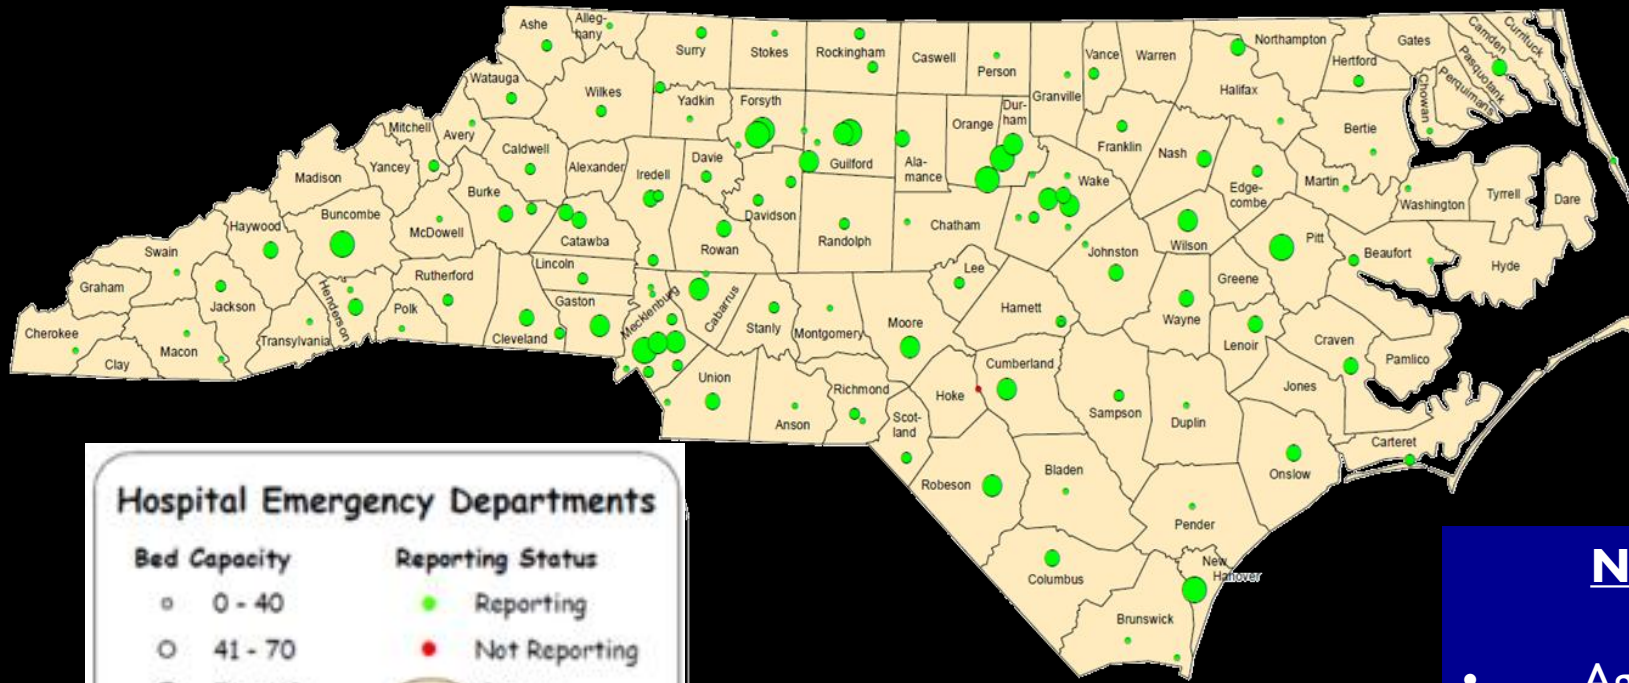

Marked Variation in Heat Illness Across North Carolina

2. Determining Relationships between Temperature and Heat Illness

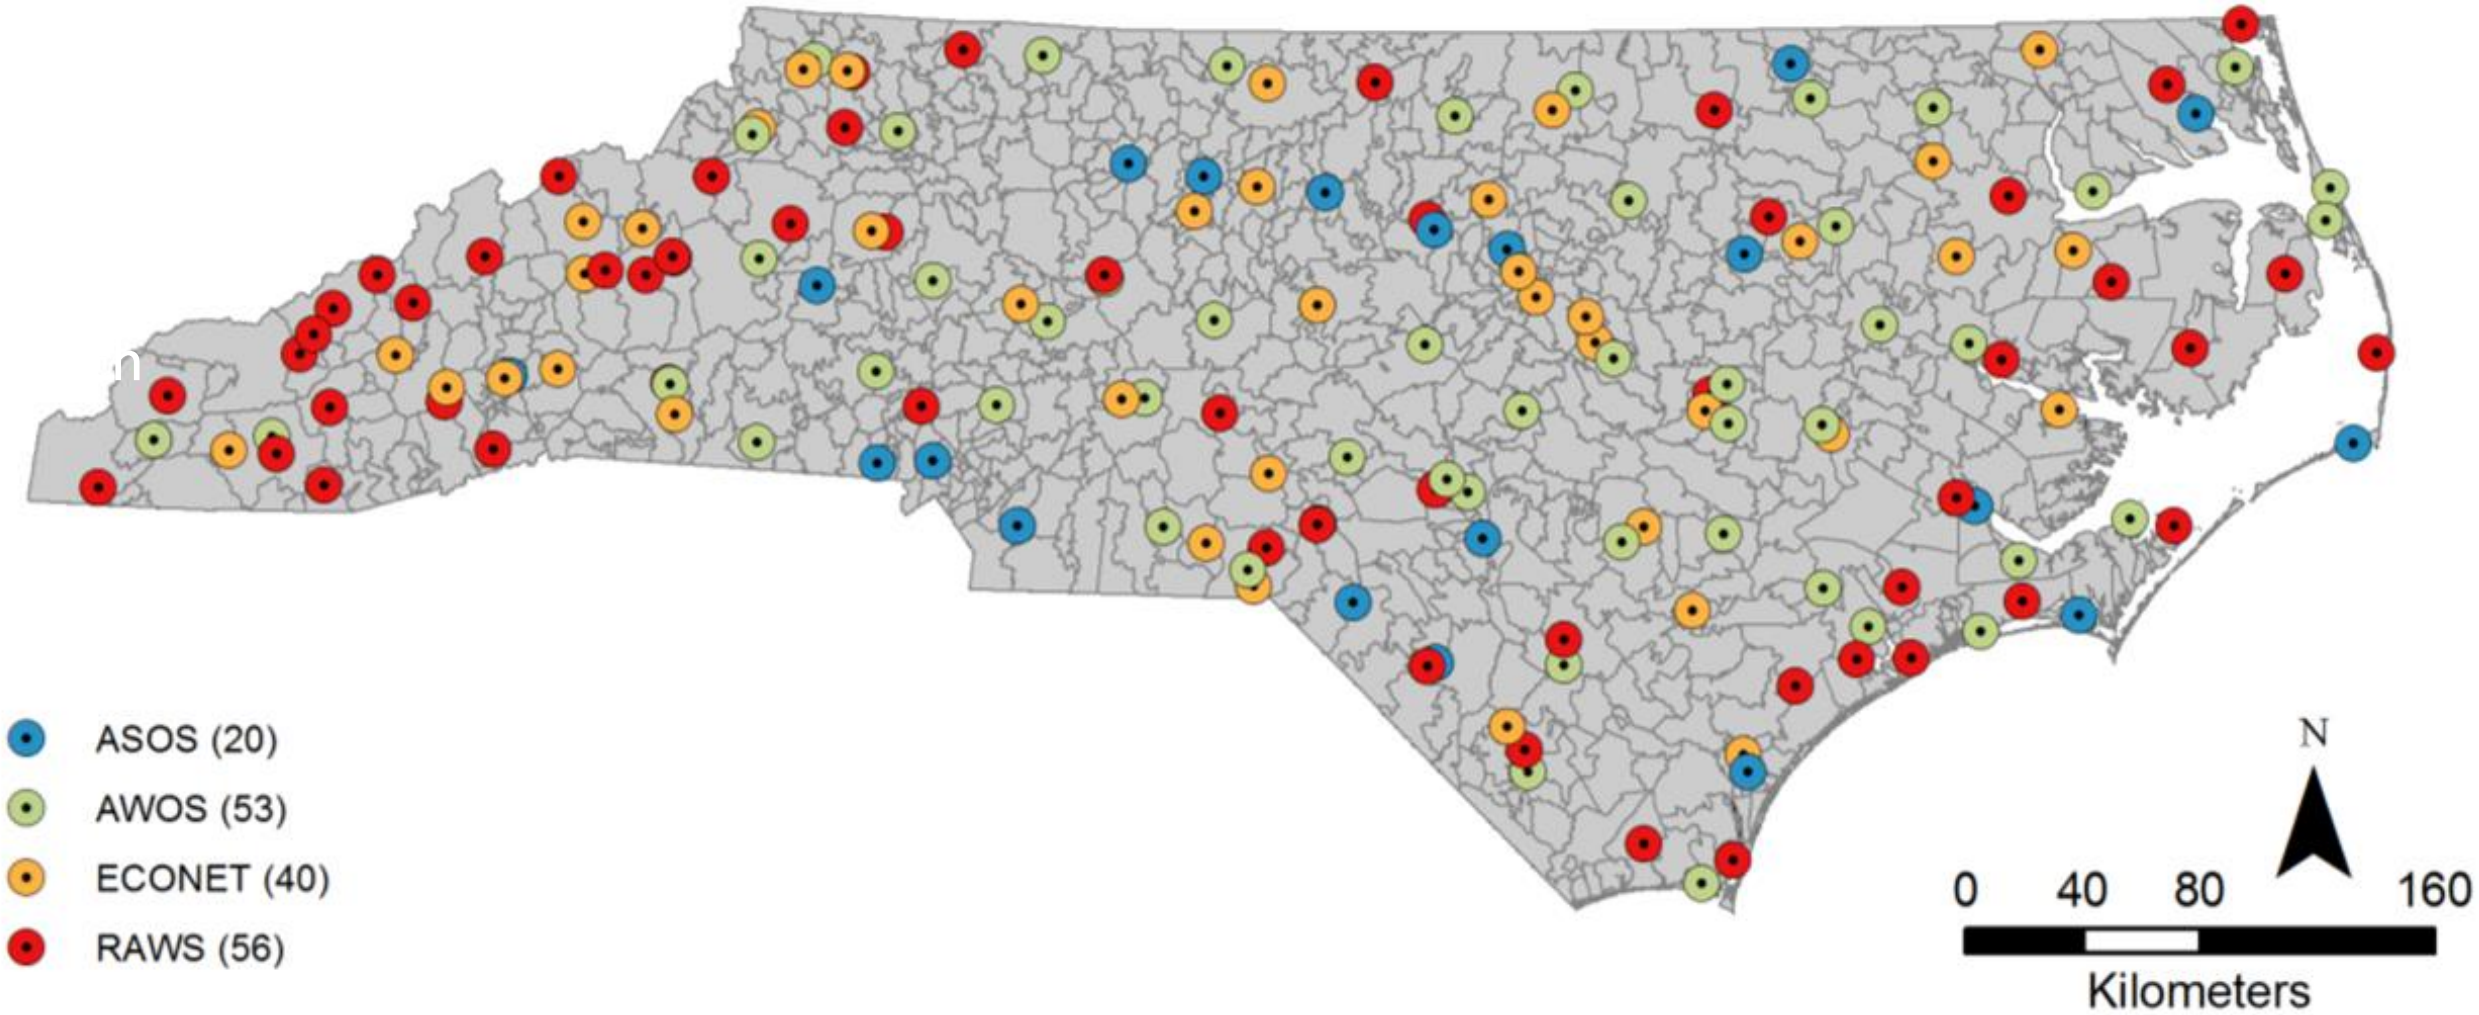

North Carolina Disease Event Tracking and Epidemiologic Tool (NC DETECT)

NC- DETECT (2007 – 2012)

- Age
- Gender
- Date and Time of Visit
- All diagnostic codes(992)
- Zip code/County
- Insurance information

ED visit linked to the daily maximum temperature at the nearest weather station.

HRI rates are adjusted for the frequency of temperature observations → **Average daily HRI ED Visits Per 100,000 people**

More ED visits on abnormally hot (95 to 100F) days but marked decrease in HRI rates at the highest temperatures (greater than 100F)

Rural Urban Commuting Areas (RUCA) Classification

Metropolitan

Rural Metropolitan

3. The Heat-Health Vulnerability Tool

Web-Based Heat-Health Vulnerability Tool (HHVT)

Inputs NWS maximum temperature forecasts and translates these values into predictions of the number of cases of heat illness.

- County or region level
- Demographic/socioeconomic group
(e.g. adult males, those in poverty etc.)

Piedmont/Coastal Plain Rural Metropolitan (Male 18-45 years old) Model for Robeson County at Lumberton Municipal Airport (KLBT)

Observations from 2013-08-04 through 2013-08-10

NDFD forecast issued 2013-08-11

Maximum Temperature for Robeson County at Lumberton Municipal Airport (KLBT)

Observations from 2013-08-04 through 2013-08-10

NDFD forecast issued 2013-08-11

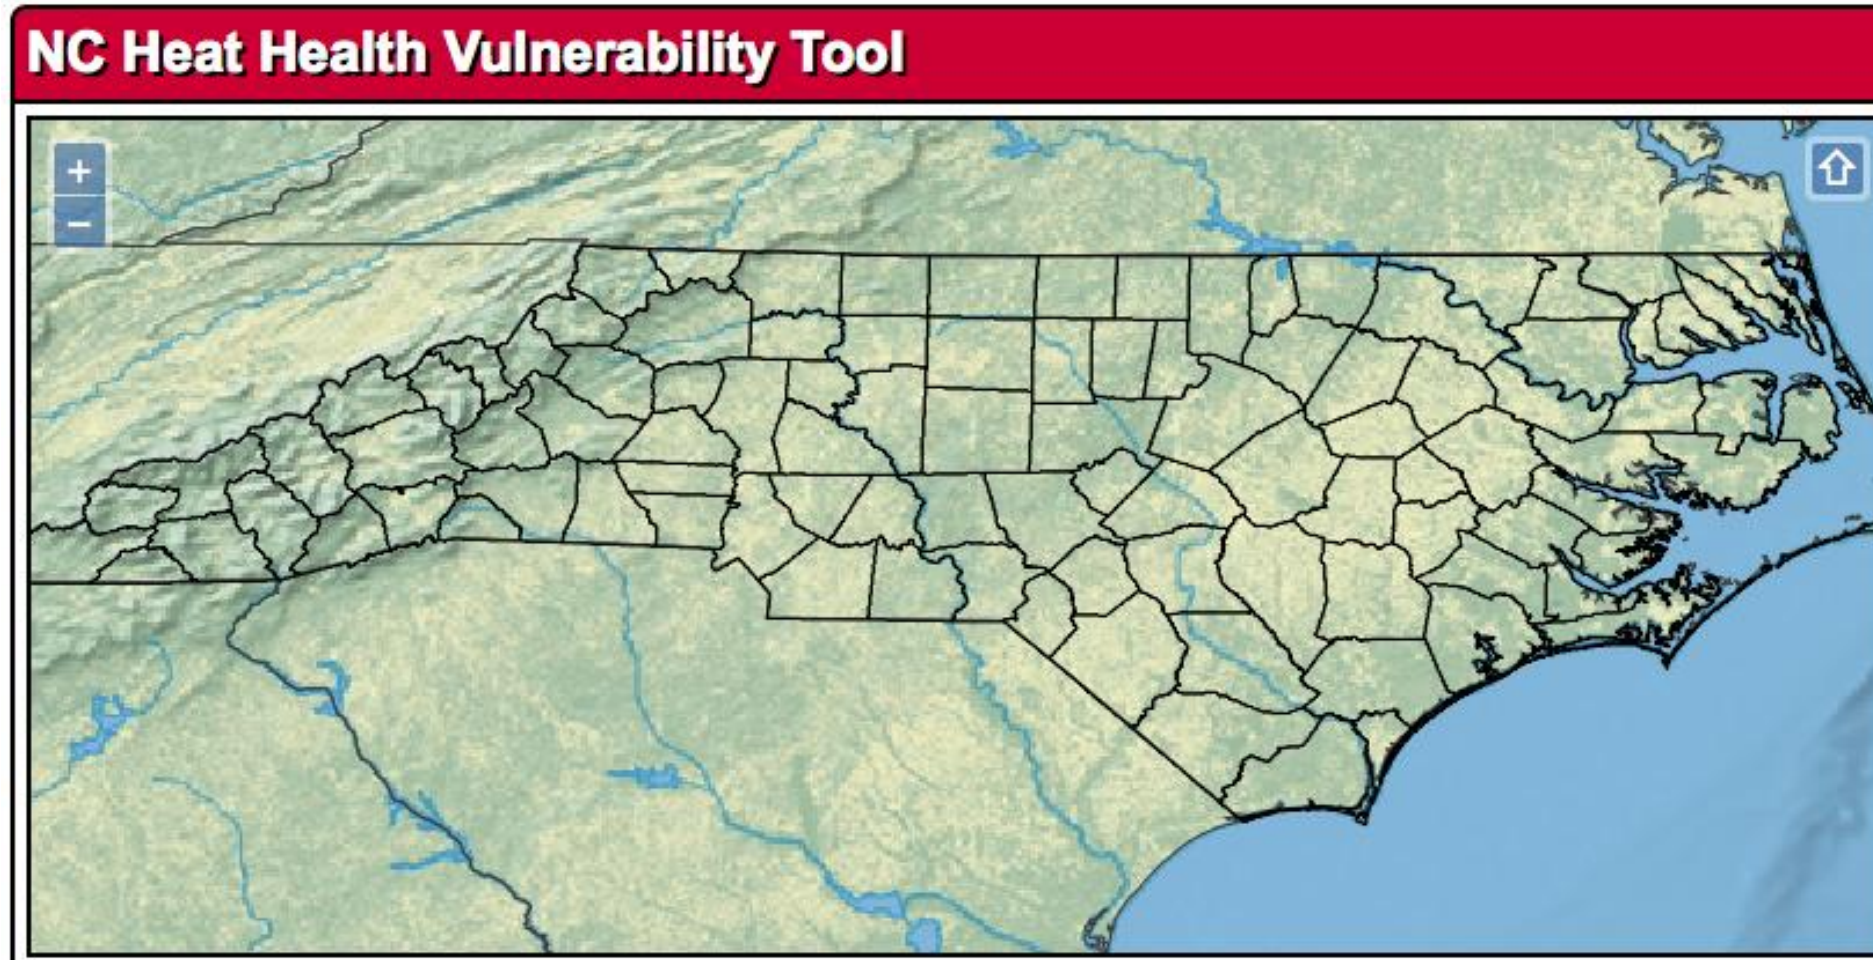

4. Our Engagement with Stakeholders and What We Learned

Two User Engagement Sessions

- Webinar on 8/1/2015 in which tool was introduced
- Face-to-face meeting on 9/1/2105

A. Challenges with the interface

i. Clickable map

A. Challenges with the interface (continued)

NC Heat Health Vulnerability Tool

SELECT A COUNTY

Bladen County

SELECT A MODEL

✓ -----

Isolated Rural (Per Capita Degree)

Piedmont/Coastal Plain Rural isolated and together

15 to 17 (entire state)

Piedmont/Coastal Plain Rural Metropolitan (Male 18–45 years old)

Piedmont/Coastal Plain Rural isolated (Male 18–45 years old)

ii. Interpreting models

An arrow pointing from the text 'ii. Interpreting models' to the model selection dropdown menu in the interface.

A. Challenges with the interface (continued)

Select a county:

Bladen County

Select a model:

Isolated Rural (Per Capita Degree)

Category

☒ PerCapitaDegree

☒ Upper / Lower

Choose a display color: Red

Choose a valid forecast date:

August

10

2013

Graph

iii. Providing plotting options

B. Interpreting the model output

Piedmont/Coastal Plain Rural Metropolitan (Male 18-45 years old) Model for Robeson County at Lumberton Municipal Airport (KLBT)

Observations from 2013-08-04 through 2013-08-10

NDFD forecast issued 2013-08-11

i. For **average visits** and the **baseline**, what are the units “expected visits per capita”?

Express as a **departure from normal** in units of percent

ii. What is “**baseline**”?

Simply express as the “**normal**” or “**normal number of visits**”

c. How can level of threat posed by the heat be effectively expressed?

Air Quality Index for Ozone

Index Values (Conc. Range)	Air Quality Descriptors	Cautionary Statements for Ozone
0 – 50 (0-60 ppb)	Good	No health impacts are expected when air quality is in this range.
51 – 100 (61-75 ppb)	Moderate	Unusually sensitive people should consider limiting prolonged outdoor exertion
101 – 150 (76-104 ppb)	Unhealthy for Sensitive Groups	Active children and adults, and people with respiratory disease, such as asthma, should limit prolonged outdoor exertion
151 – 200 (105-115 ppb)	Unhealthy	Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children should limit prolonged outdoor exertion.
201 – 300 (116-374 ppb)	Very Unhealthy	Active children and adults, and people with respiratory disease, such as asthma, should avoid all outdoor exertion; everyone else, especially children, should limit outdoor exertion.

- Much interest in translating the daily forecast into a threat level using a color scale from 1-5:
- Work with public health professionals to develop an appropriate scale.

D. "Its not the heat. It's the humidity!"

<http://marshallramsey.com/?p=11410>

PLAN: Launch Version 2.0 of the Heat-Health Vulnerability Tool in May with the following upgrades:

- 1) Work off of predictions of the **daily maximum heat index**
- 2) Add a **threat scale** to each forecast
- 3) Refine interface and provide help menus and better explanations

Heat Health Vulnerability Tool: <http://sercc.com/hhvt>
